

TravAID — Handle a Tyre Blowout

Duration: Immediate • Difficulty: Hard

Safety: A blowout at speed is one of the most dangerous events on the highway. Do NOT brake hard — counterintuitive but critical.

Step 1. Grip the wheel firmly

Both hands. Expect a sudden pull toward the side of the blown tyre — correct gently, do not over-steer.

Step 2. Do NOT brake

Slamming the brakes causes weight to shift forward and the car to spin. Let the engine slow you naturally.

Step 3. Ease off the accelerator gradually

Allow speed to drop slowly. Keep the car pointed straight.

Step 4. Signal and steer to the shoulder

Once below ~30 km/h, gently brake and steer to the hard shoulder, well off the carriageway.

Step 5. Hazard lights & warning triangle

Turn on hazards. Place a reflective triangle 50–100m behind the car. Get all passengers behind the safety barrier, away from traffic.

Step 6. Call for help

Use TravAID or the highway helpline (1033 in India). Never attempt to change a tyre on the carriageway side.
